

Low Energy High Rise.

Sustainable solutions
for the future.

Sustainable solutions for the future

Paul Vick Architects has developed a low energy, long lasting, high density, mixed use residential and retail building for a pension fund.

Creating a building that needs to hold its value for a long time is coterminous with sustainable construction and living.

Working with durable materials and layouts that will last, look good for longer than a generation and can be constructed competitively, brings a tangible value to the owner and occupiers.

In an area where there is much discussion and limited real solutions, this is meaningful estate planning for the future.
